

Simple: flat list, equal weights

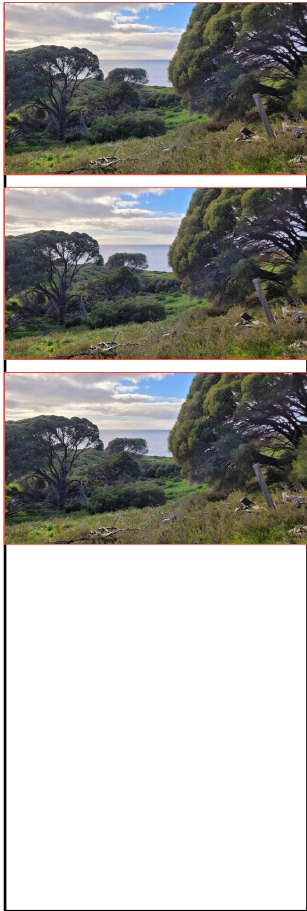

3 images, best layout (selector “1”)

4 images, best layout

A tall, narrow box naturally leads to a vertical-rooted tree

Weights: steering how much area each item gets

One item weighted much higher than the others

All weights different (1, 2, 4)

Ranking: stepping through different tree shapes

Rank 1 vs. rank 2 vs. rank 3 for the same 4 items

Out-of-range rank clamps to the worst available tree

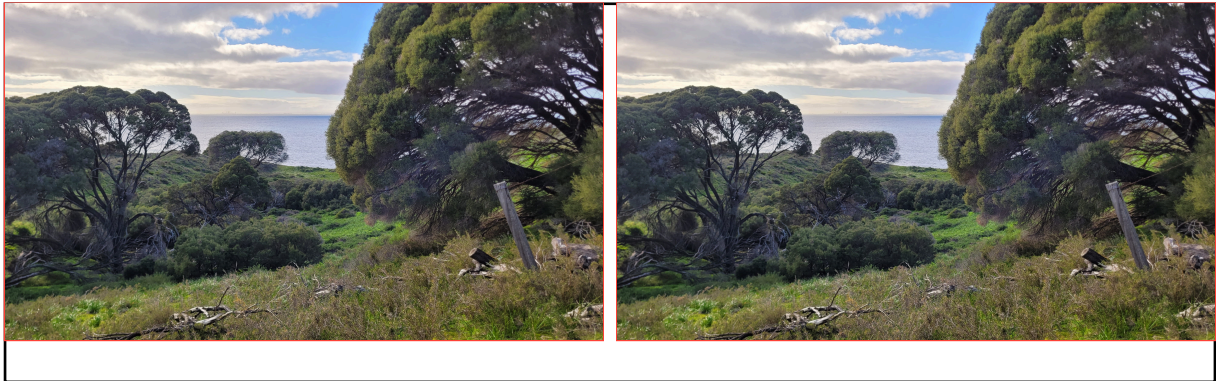

Symmetries: same rank, different mirrored variants

Rank 1 and its reflection variants (“1”, “1.”, “1..”)

Extra dots wrap around instead of erroring

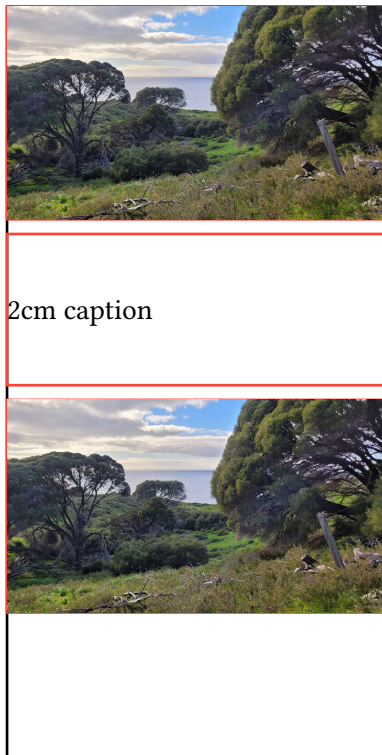

Constant-size elements

Constant-width caption, wide box (horizontal root wins)

Same caption, tall box (vertical root wins, constant-size becomes height)

Stretchable elements

Stretchable caption absorbs leftover space

Stretchable caption

Everything combined

Weights + constant-size + stretchable, stepping through rank and symmetry
